

Approved Sample Lesson - Motion, Speed, and Acceleration

Lesson aim

This sample shows the expected depth and organization for a physics lesson. It isn't a template that needs to be copied section for section.

The lesson starts with a small example, explains the main idea, gives a worked example, then moves into practice and a short check.

Teaching section

Motion, Speed, and Acceleration is introduced using one concrete example before formal terminology. The explanation keeps the main rule visible and avoids unrelated advanced material.

A second example changes the context slightly so learners have to recognize the same idea in a new form.

Practice

Practice includes one recognition item, one predict/trace item, one correction item, and one short build or explanation task.

The answer key explains the main reason, especially where a common misconception is likely.
